

The effectiveness of automation technology in identifying potential adverse events in common safety data sources

Based on IQVIA Vigilance Detect performance results 2018-2022

About the Presenters

Marie Flanagan

Director, Offering Management, Vigilance Detect

Areas of expertise

Marie has 17 years' experience in PV operations, strategy and consulting. In her tenure, she has held various leadership positions in PV operational management, the integration of safety technology and services and the strategic expansion efforts of IQVIA's pharmacovigilance department. In her current role, she supports the evolution of safety risk identification technology in response to evolving industry needs.

Contact

Marie.Flanagan@iqvia.com

Education

Marie earned a Master's of Science with first class honors from University College Cork, Ireland.

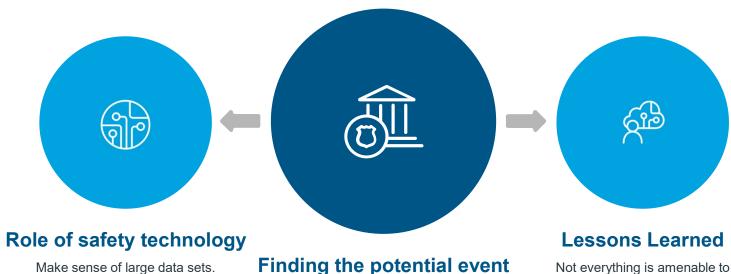

Agenda

- + The application of technology in identifying potential safety risks
- + Results
 - A look at effectiveness of safety risk identification technology across various source types
- + Conclusion

Finding risks in large data sets

Make sense of large data sets.

Reduce manual labour.

Enable compliance.

Finding the potential event

Borne of a regulatory requirement.

Exceedingly time consuming.

An excellent use case for automation technology

automation.

Technology supported by human expertise is essential.

Sources, systems and safety teams will always evolve in unpredictable ways.

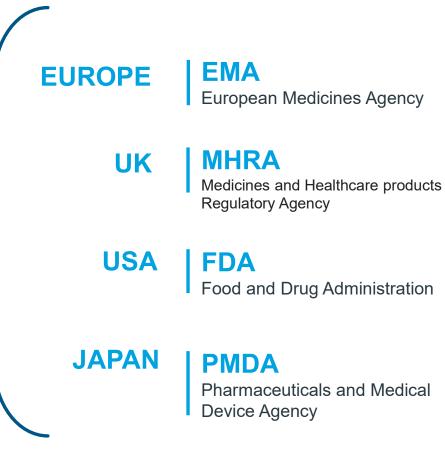

Regulatory requirements drive the need for safety risk identification

Marketing authorization holders must:

- Comply with Adverse Event (AE) regulatory reporting requirements.
- Regularly screen the internet or digital media under their management or responsibility for potential reports of suspected AE.
- When aware of relevant information from other source, they should review for reportability.

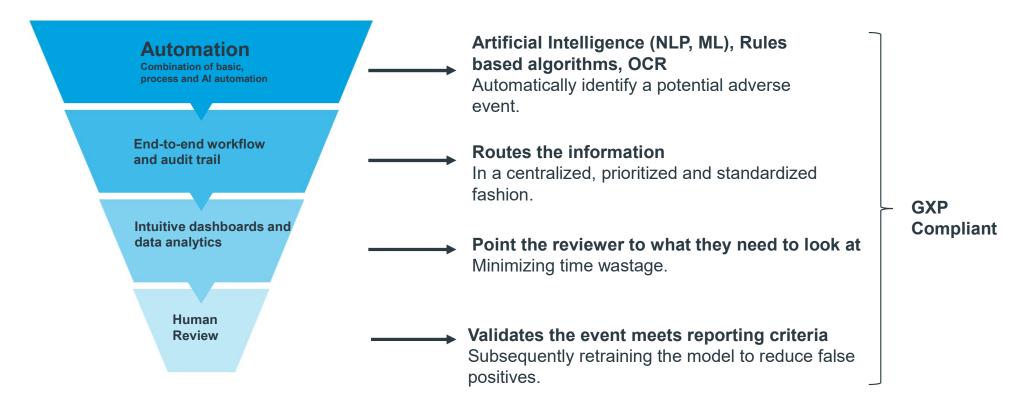

Results

A look at effectiveness of safety risk identification technology across various source types

Based on anonymized IQVIA Vigilance Detect cumulative data from varying time ranges 2018-2022

Key components of a successful tech-enabled solution

The sources

Social and Digital Data

- Company-owned handles and public social media campaigns e.g., Facebook, Twitter, Instagram, Reddit, YouTube, TikTok etc.
- Data from Apps and wearables.

Virtual Al Agent

Person: chatbot, Al agent interactions for the presence of adverse events.

Patient Support

Multiple formats, structured and unstructured data arising from patient programs.

CRM

Remediation and retrospective review of data residing in CRM.

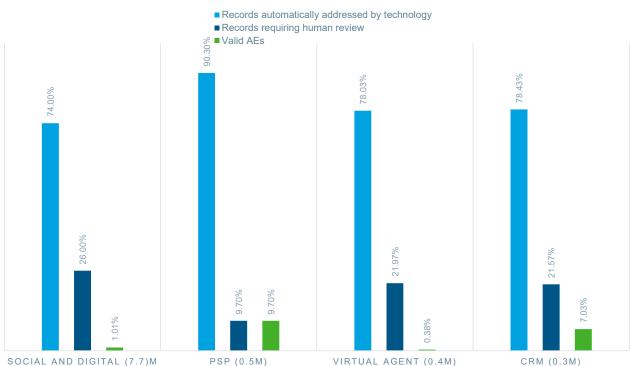

% technology vs human intervention in identifying safety risk?

Technology vs human intervention in identifying safety risk

"The whole is greater than the sum of its parts"

Virtual Agents and CRM sources utilize similar solution components with similar results.

PSP and Social Media use **varied** solution components to maximize results.

Technology tips the balance over human review in addressing volumes in all sources.

■IQVIATECHNOLOGIES

Virtual Al Agents and CRM (Case Study)

78%

Technology (Automation: Artificial Intelligence)

Solution embedded with robust safety specific patterns.

22%

Human Review

Identified valid safety events from false positives.

Assisted machine learning.

Artificial Intelligence (NLP)

End-to-end workflow and audit trail

Intuitive dashboards and data analytics

Rapid identification of valid safety events

Human

Review

CRM and Chatbots

are a clear-cut use case for AI/NLP:

Structured, leading questions (chatbot)
Trained personnel entering data
(CRM).

Leverage basic process automation/workflow but to a much lesser extent to achieve efficiencies.

With all sources, human review is required.

CRM Data Based on 0.3M records 2020-2021, 0.23M addressed by Detect ontologies alone Chatbot/Virtual AI Agent Data based on 0.4M records 2020-2021, 0.29M addressed by Detect ontologies

Patient Support Program (Case Study)

90%

Technology

Solution embedded with robust safety specific patterns

10%

Human Review

Identified valid safety events from false positives

Assisted machine learning, rules _

Al (NLP), Rules based algorithms, OCR

37% AI (NLP)

53%OCR and basic-process automation

End-to-end workflow and audit trail

Intuitive dashboards and data analytics

Human Review **AI (NLP)** had an effectiveness of 37% on its own.

Increases to 90% with a strategic combination of RPA, OCR, basic/process automation.

Leaving only 10% of digital records for human review.

Social Media (Case Study)

74%

Technology

Solution embedded with robust safety specific patterns including slang, emoji character recognition

26%

Human Review

Identified valid safety events from false positives and reviewed AV/EURL files Assisted machine learning Al (NLP) and deduplication

End-to-end workflow and audit trail

Intuitive dashboards and data analytics

Human Review

Rapid identification of valid safety events

Of 7.7M social/digital records, Al moves 74% out of the workflow.

26% are routed for manual review to:

- 1) validate identified events
- 2) review AV and EURL records

Benefit is felt in the reduced volume of irrelevant data hitting the safety database/eQMS complaints module.

Case study based on anonymised Detect social media and digital data 2018-2022.

Efficiency of safety risk identification technology in social and digital data

A look at the last five years

Efficiency = Records removed from human workflow by technology

% efficiency gains commensurate to volume growth

Outliers like 2019 are 'to be expected'

Anonymized data collected from Detect Social and Digital media sources 2018-Q2 2022

Ontologies

- enable detection of adverse events, product quality complaints, off-label use and other risks.
- use pattern recognition and word proximity within sentences
- identify colloquialisms, slang, emojis and mis-spellings
- mapped to ICD-10 and MedDRA, higher and lower-level terms.

Supervised learning supports improvements, updates, pattern building and reductions in false positives.

Conclusion

The whole is greater than the sum of its parts"

Aristotle

Data-driven insights

- + **Synergy:** Artificial Intelligence (in all its forms), automation technology (in all its forms) and humans (in all our forms) are gifted solutions to the safety industry's challenges but yield far more impressive results combined vs used in isolation.
- + **Needle in the haystack:** Data shows us a tremendous amount of effort is required to find a very small percentage of valid ICSRs. There is a lot of noise, but there is also relevant safety information that tech can find with little human effort.
- + Human effort is consistently required: To validate what 'bubbles up' is of relevance to safety, to assist ML/rewriting of rules and for instances where tech can't make sense of the data as easily, e.g., embedded URLs, AV files. In good news, we can see technology is remarkably effective at keeping noise at a minimum to allow humans to focus their attentions.
